

Teacher-Free Adaptive Inquiry Under World Change

Anonymous Authors

Abstract

This paper will test whether Suite C re-engagement can be learned without teacher labels. The current learned probe head transfers a hand-policy inquiry law; the next result must train from downstream recovery, cost, and intervention feedback while preserving the same C1-C6 and learned-signal controls.

1 Introduction

State the reviewer objection: imitation of a hand-designed inquiry law is weaker than teacher-free adaptive inquiry.

2 Suite C Task

Describe two world shifts, affected and unaffected buckets, probe cost, recovery, false calm, and second-shift re-openability.

3 Teacher-Free Training

Compare reward-trained policy search, self-supervised value-of-information, and contrastive stress policy variants.

4 Gates and Controls

Report C1-C6, T1 no-teacher-label audit, stale/wrong/suppressed signal controls, and matched random budget.

5 Results

Reserved for the actual run.

6 Limitations

Finite simulator, no biological or consciousness claim, no production-agent claim, long-horizon/open-agent transfer remains open.
